

Active Power Down

Business Benefits

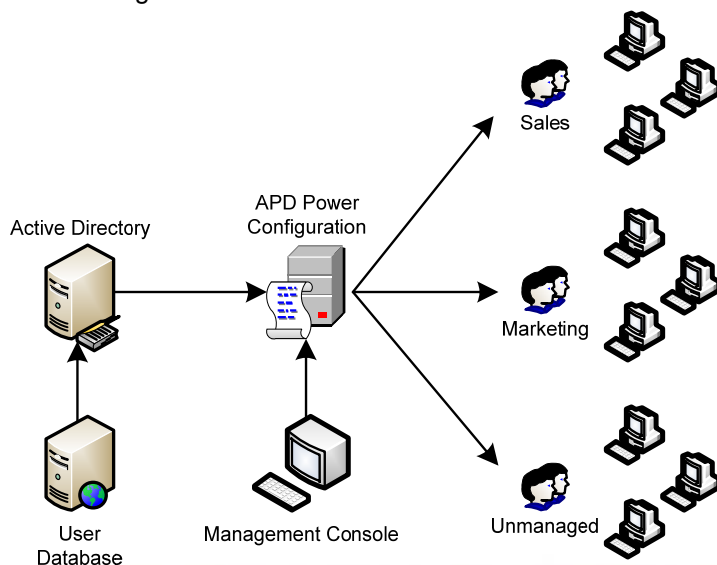

- Reduce electricity bills by £20-£60 per PC per annum
- Reduction in CO₂ emissions
- Return on investment in 3-6 months
- Assists with CRC EES

Active Power Down Overview

Active Power Down is a centralized power management system that reduces the electricity consumption of PCs on your network, by optimizing PC power settings.

How it works

- Power profiles for different groups of users and machines are defined.
- Active Power Down is installed on your Active Directory.
- Power management groups are created and populated.
- When the PC starts up, the software applies the power profile assigned to the machine. Each time a user logs on, the software applies the power profile assigned to the user.

The opportunity

Research shows that at least 30% of the overall IT power bill is consumed by PC's, the majority of which are not centrally power managed. - Gartner

The solution

Implementing a PC power management solution significantly reduces power consumption compared to PCs without power management software.

Why Active Power Down?

Active Power Down is designed to deliver energy savings quickly.

No agent. No need to test on existing images speeding implementation.

Minimal resourcing - deployed with minimal impact on your team.

No hidden costs - no additional hardware or software required to support Active Power Down implementation.
